The Routers

- The traffic in a network is inherently bursty
 - The role of the buffers in the router is to smooth the flow of traffic.
- Bottleneck Routers
 - Each packet is squeezed down in bandwidth, it must stretch out in time since its size stays constant.

What is Bufferbloat?

- As stated by *Jim Gettys*
 - Today's networks are suffering from unnecessary latency and poor system performance.
 - Large buffers damage or defeat the fundamental congestion-avoidance algorithms of the Internet's most common transport protocol.

Bufferbloat

"The existence of excessively large and frequently full buffers inside the network".

Introduction

Results

Conclusions & Discussion

General Objectives

- To define the Bufferbloat phenomenon, and explain the impact that it could have on latency and Throughput(related to System Throughput) in Internet.
- To detect its presence by measurements of the latency and throughput in a TCP/IP Network.
- To propose solutions in the implementation of a network where the existence of excessively large and frequently buffers are detected.

Introduction

Hidden Flaws and Bufferbloat

Experimental Work & Results

Test Setup
Results

Conclusions & Discussion

Secondary Objectives

- Develop appropriate tests to be able to prove the existence of Bufferbloat.
- To test and differentiate the possible causes of the excessive latency and throughput reduction in a TCP/IP LAN and check how much is generated by Bufferbloat or by a miss-configuration.
- To propose configuration of the TCP parameters in a Linux based machine or an algorithm that can help to minimize the phenomenon.

TCP's Phases

1 Slow Start

- Exponentially increase of the sending rate.
- Increase ***cwin*** until ***ssthresh***.

2 Congestion Avoidance

- Optimal utilization preventing congestion.
- Most common: Cubic & CTCP.

3 Fast Retransmit & Recovery

- Recover from lost without much hurt.
- Continuous transmitting of new data on subsequent duplicate acknowledgments.

Router's Impact

Main Functions

- To absorb bursts of traffic coming from the hosts.
- To ensure that links are used to their maximum capacity.
- The presence of buffers is necessary to help reduce data loss.
- The absence of timely notification triggers the presence of full buffers and increased communication latency.

Full Buffers

Packets at bottleneck queue

The packet is squeezed down in bandwidth but must stretch out in time since its size stays constant.

Standing Queue

if rate @*packets* are received \gg delay to process and remove a package from the buffer.

"This standing queue is the essence of Bufferbloat only creating long delays in communication."

Other Factors

High Latency

- Large buffers only increase latency.
- It is quite common to find these high-latency queues in the last mile.

Sizing Router's Buffers

- Unmanaged buffers are more critical today
- Buffers sizes are larger, delay-sensitive applications are more prevalent, and large downloads common
- Rule-of-Thumb **$B = RTT * C$**

Queue management

Active Queue Management

"FIFO based queue management mechanisms to support end-to-end congestion control"

Objectives

- Reduce the average queue length.
- Decrease the end-to-end delay.
- Reduce packet losses → more efficient resource allocation.

Algorithms

1 Random Early Detection - RED

- Can provide high throughput and low average delay, but it's complex to configure properly .

2 BLUE

- Based directly on packet loss and link utilization, can reduce the buffer size and the end-to-end delay.

3 Control Delay - CoDel

- Based on the idea of a threshold. Beside the minimum packet sojourn, CoDel needs the target and interval time.

Evolution of Components

- Use's Evolution
- “The more is better” mentality.
- Flows synchronization.
- Packet lost seen as a problem.

Test Description

Test Context

- 1 Twice on the same day in one network to determine if does exist a considerable variance in latency for different times in a day.
- 2 Select different public and private networks with different "speeds".
- 3 Use the Ethernet cable in order to compare the results with those previo1usly obtained using Wireless.

Results

Conclusions &
Discussion

Results

- The $\sim 12ms$ ping were also not obtained, but the values are still within the acceptable range around the $\sim 26ms$.
- The variation of the ratio between the measured and the bandwidth contracted is of 80%, which is only 6% less than spected.
